Approval Testing

A different paradigm for Assertion

Parts of a Test Case

```
15  @Test
16  public void getSpeedOfAfricanParrot_With_One_Coconut() {
17      Parrot parrot = new Parrot(ParrotTypeEnum.AFRICAN, 1, 0, false);
18      assertEquals(parrot.getSpeed(), 3.0);
19  }
```

16 - Test Case Name

17 - Arrange

18 - Act

18 - Assert

Potential problems?

```
15      @Test
16      public void getSpeedOfAfricanParrot_With_One_Coconut() {
17          Parrot parrot = new Parrot(ParrotTypeEnum.AFRICAN, 1, 0, false);
18          assertEquals(parrot.getSpeed(), 3.0);
19      }
```

- We only check one aspect of the parrot: the speed.
- If the speed changes to 3.1 the test will fail, and we have to change code to fix it.

Another way to test this?

```
32  
33  
34   @Test  
35 public void getSpeedNorwegianBlueParrot_nailed() {  
36     Parrot parrot = new Parrot(ParrotTypeEnum.NORWEGIAN_BLUE, 0, 0, true);  
37     assertEquals(parrot.toString(), "Parrot(type=NORWEGIAN_BLUE, speed=2.0)");  
38 }
```

7 tests done: 1 failed – 33ms

/usr/lib/jvm/java-8-oracle/bin/java ...

junit.framework.ComparisonFailure: null

Expected :Parrot(type=NORWEGIAN_BLUE, speed=0.0)

Actual :Parrot(type=NORWEGIAN_BLUE, speed=2.0)

[<Click to see difference>](#)

at junit.framework.Assert.assertEquals([Assert.java:81](#))

at junit.framework.Assert.assertEquals([Assert.java:87](#))

at parrot.ParrotTest.getSpeedNorwegianBlueParrot_nailed([ParrotTest.java:36](#)) <27 internal calls>

Why don't we do this?

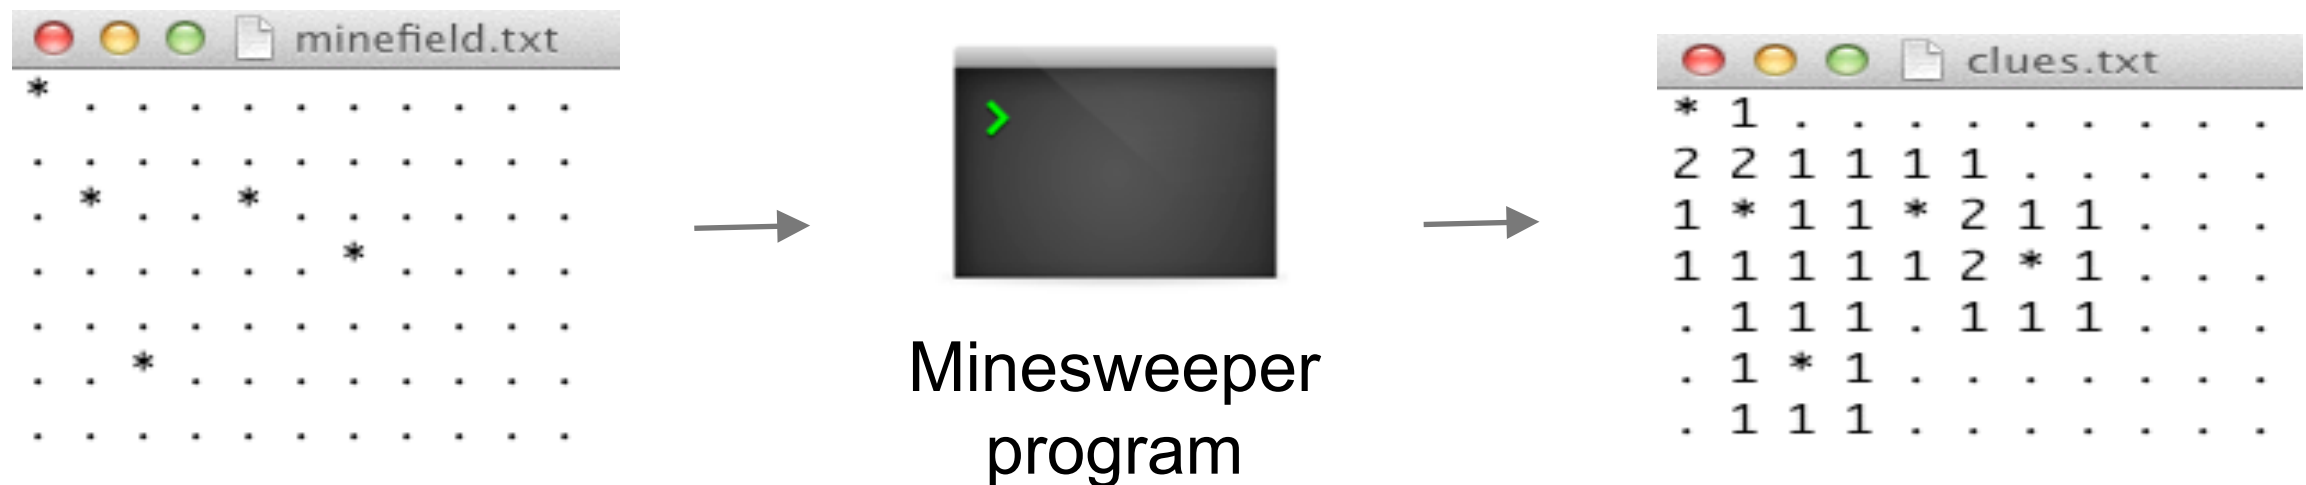

```
32  
33  
34   @Test  
35 public void getSpeedNorwegianBlueParrot_nailed() {  
36     Parrot parrot = new Parrot(ParrotTypeEnum.NORWEGIAN_BLUE, 0, 0, true);  
37     assertEquals(parrot.toString(), "Parrot(type=NORWEGIAN_BLUE, speed=2.0)");  
38 }
```

- Test isolation - many tests with similar strings
- Maintenance costs - updating comparison strings
- A lot of 'toString' methods needed
- TDD - in practice you don't write the assertions up front any more - copy and paste from actual output

Minesweeper

Minesweeper as a Command Line Program

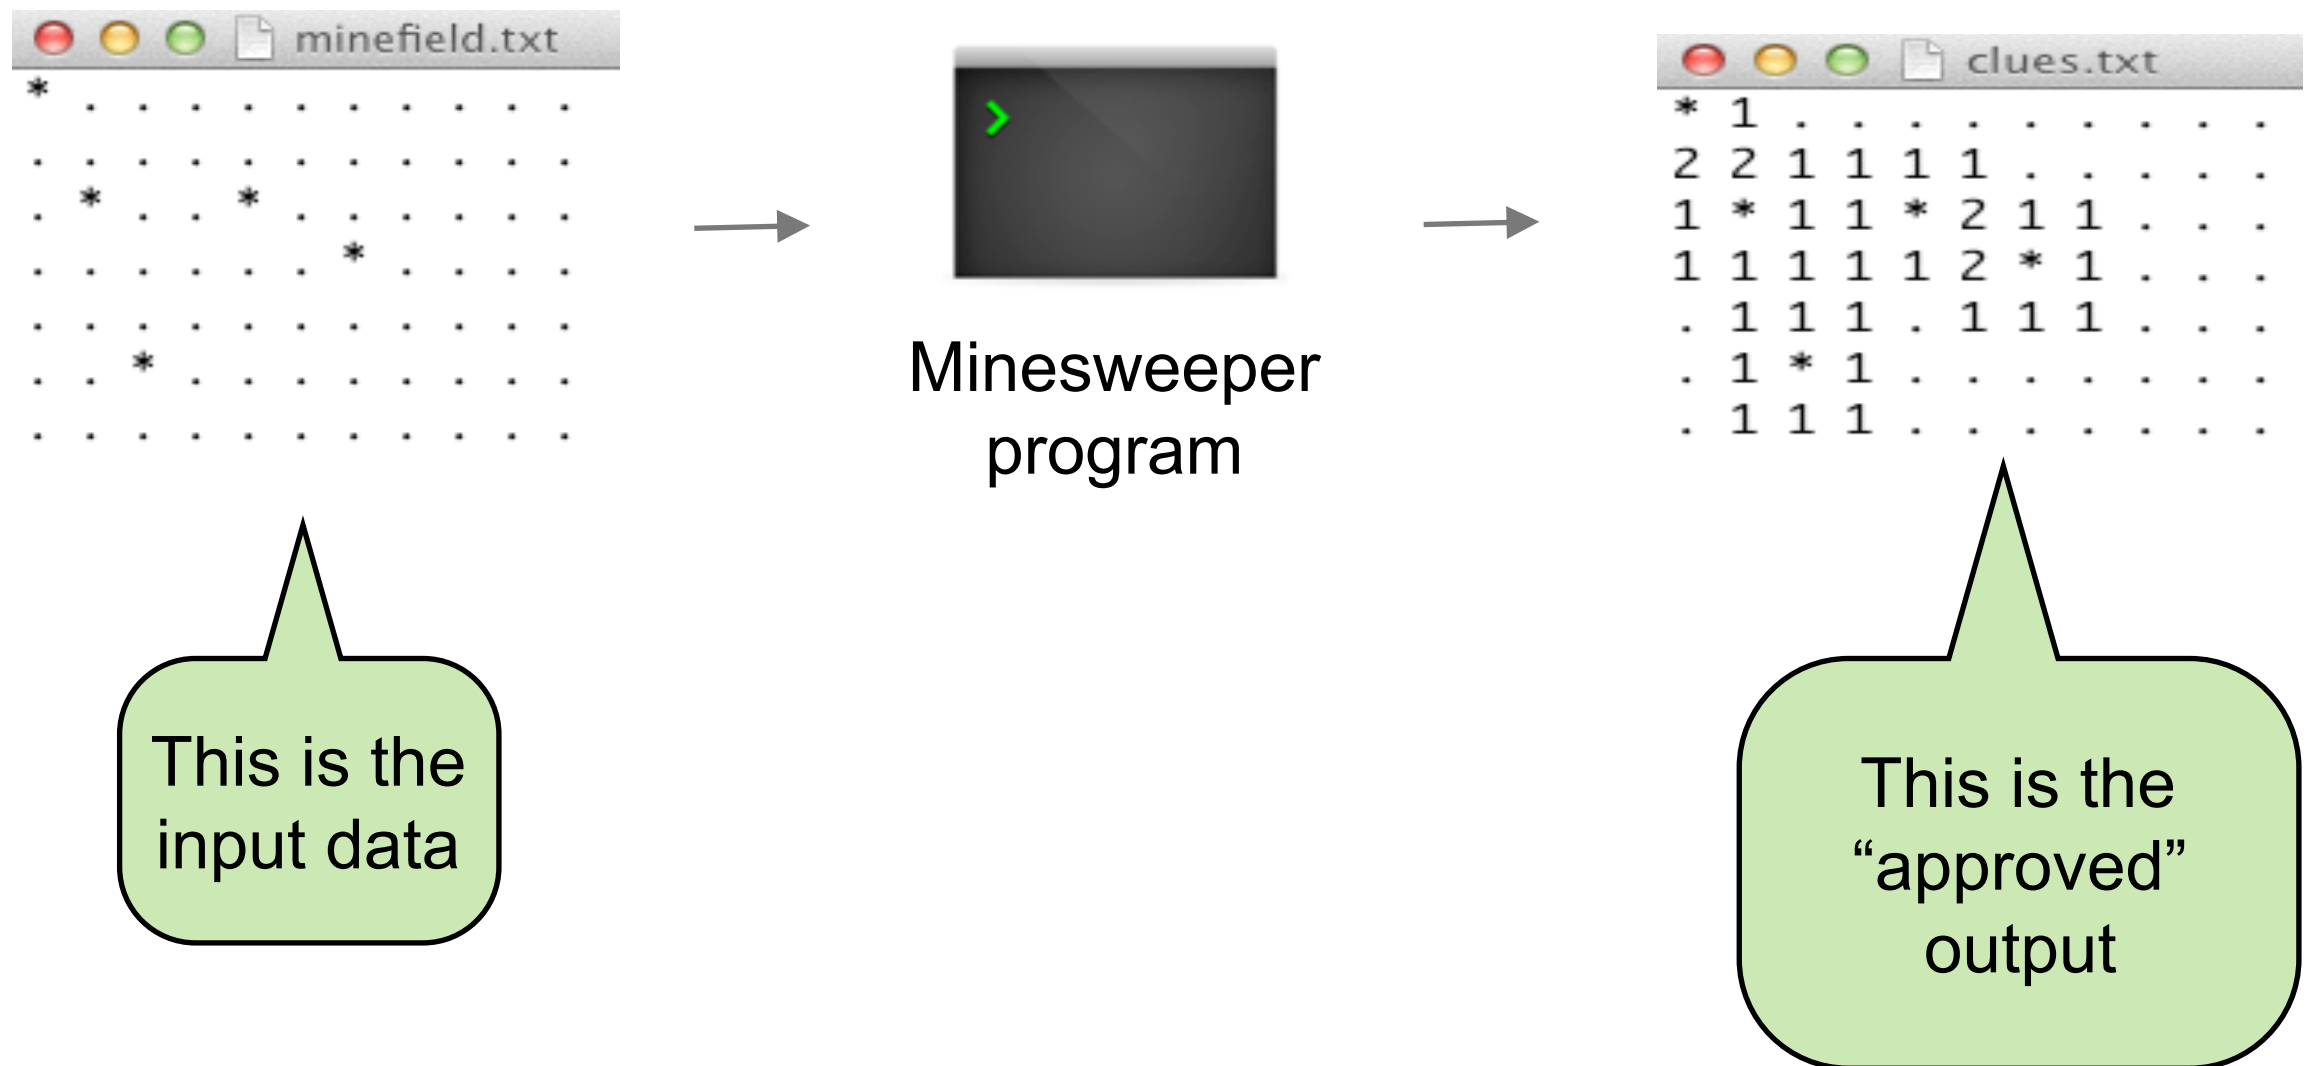

How to check for correct behaviour?

```
assertEquals(2, clueAt(0,1))
assertEquals(1, clueAt(1,0))
...
```

Approval Testing

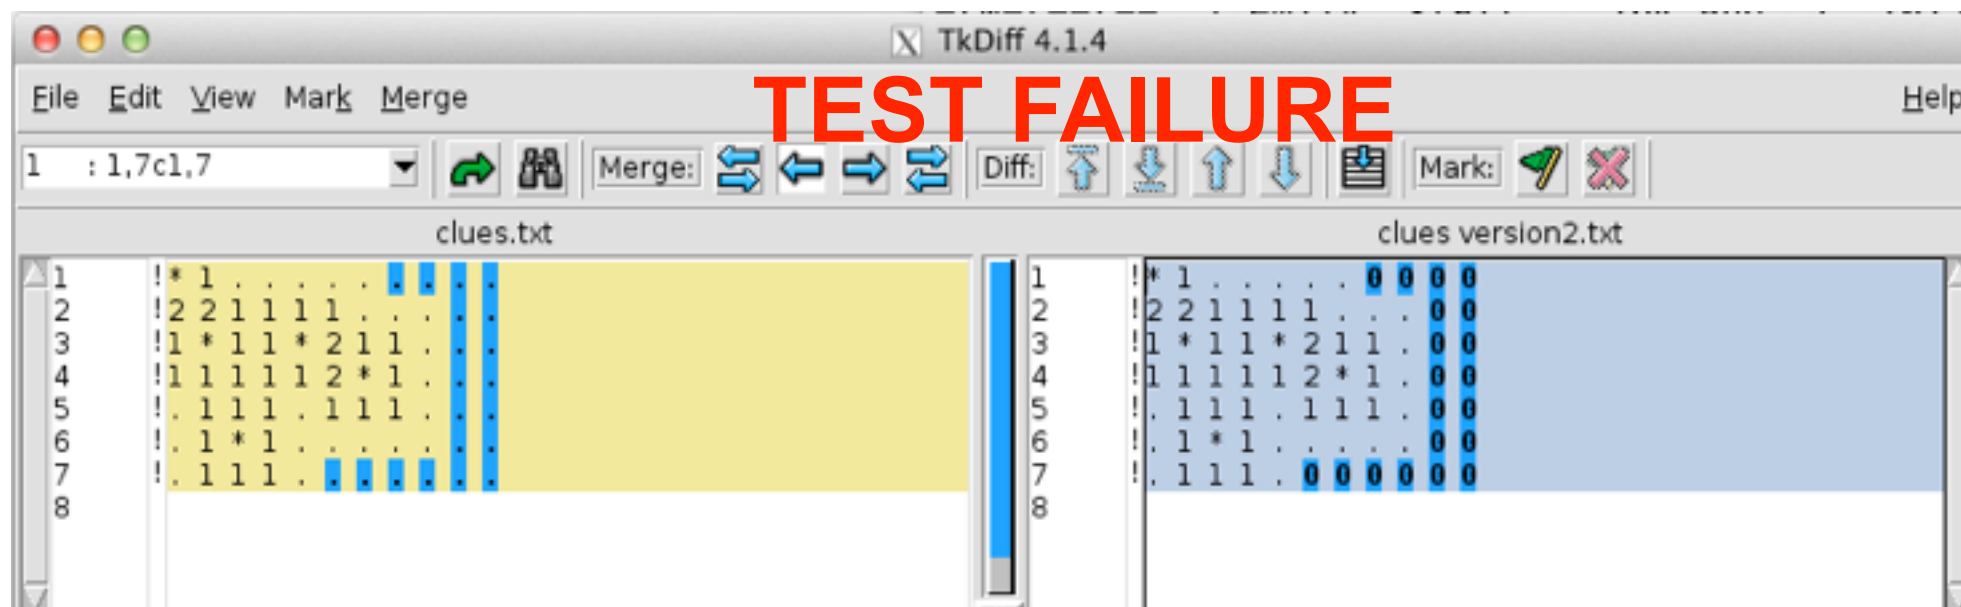

Test Failure: Textual Diff

Approved Output

```
clues.txt
* 1 . . . . .
2 2 1 1 1 1 . . .
1 * 1 1 * 2 1 1 . .
1 1 1 1 1 2 * 1 . .
. 1 1 1 . 1 1 1 . .
. 1 * 1 . . . . .
. 1 1 1 . . . . .
```

New Output

```
clues version2.t
* 1 . . . . . 0 0 0 0
2 2 1 1 1 1 . . . 0 0
1 * 1 1 * 2 1 1 . 0 0
1 1 1 1 1 2 * 1 . 0 0
. 1 1 1 . 1 1 1 . 0 0
. 1 * 1 . . . . . 0 0
. 1 1 1 . 0 0 0 0 0 0
```

Demo

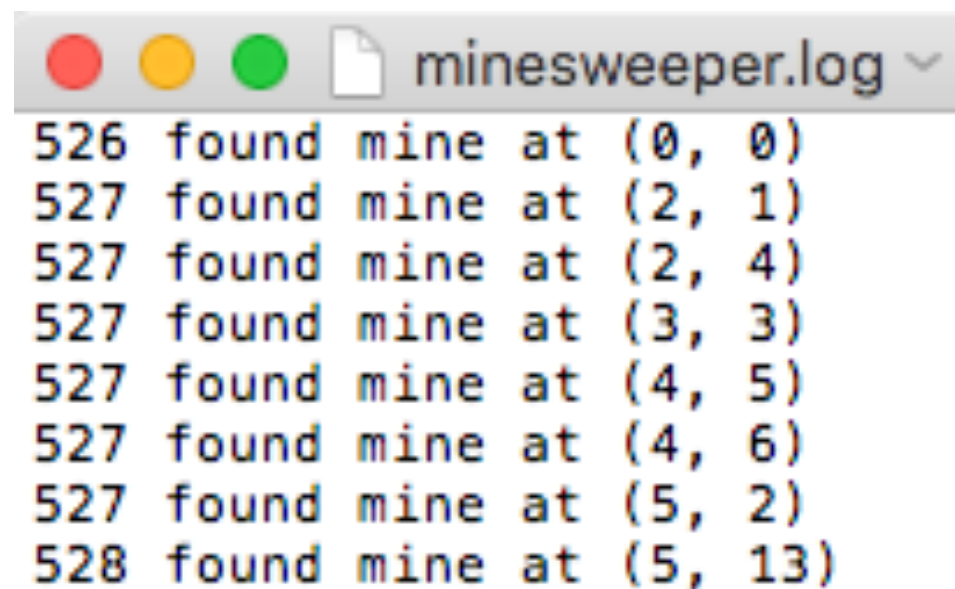

Addressing the problems

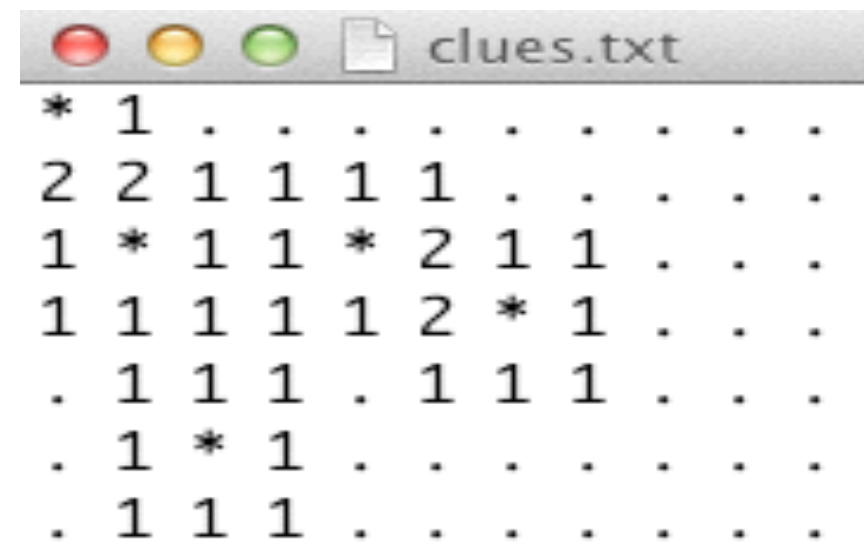

```
@Test
public void getSpeedNorwegianBlueParrot_nailed() {
    Parrot parrot = new Parrot(ParrotTypeEnum.NORWEGIAN_BLUE, 0, 0, true);
    assertEquals(parrot.toString(), "Parrot(type=NORWEGIAN_BLUE, speed=2.0)");
}
```

- Test isolation - many tests with similar strings 
- Maintenance costs - updating comparison strings 
- A lot of 'toString' methods needed 
- TDD - in practice you don't write the assertions up front any more - copy and paste from actual output 

Assert or Filter?

```
minesweeper.log
526 found mine at (0, 0)
527 found mine at (2, 1)
527 found mine at (2, 4)
527 found mine at (3, 3)
527 found mine at (4, 5)
527 found mine at (4, 6)
527 found mine at (5, 2)
528 found mine at (5, 13)
```

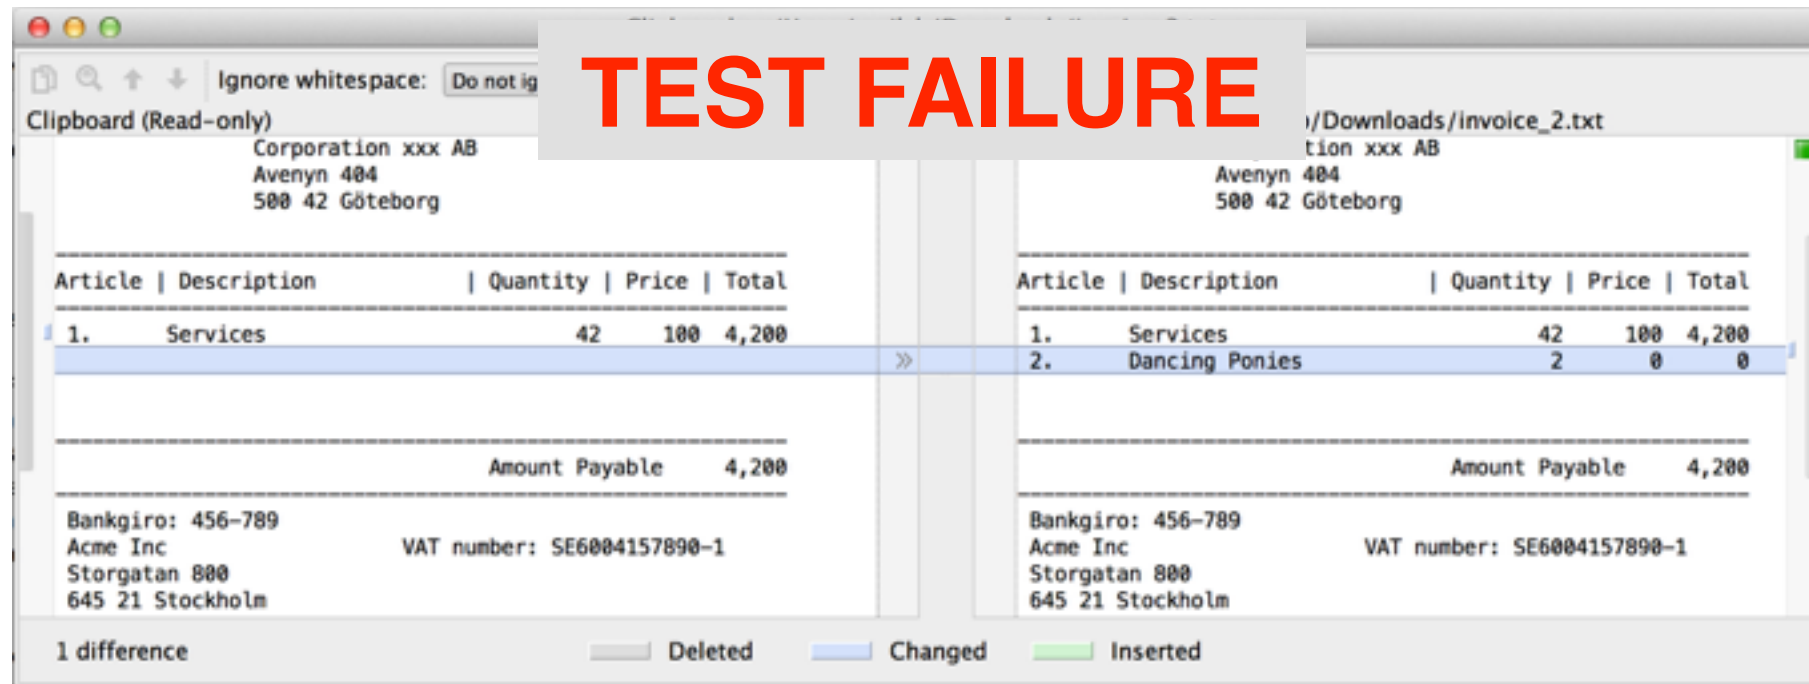

```
clues.txt
* 1 . . . . . . . .
2 2 1 1 1 1 . . . .
1 * 1 1 * 2 1 1 . . .
1 1 1 1 1 2 * 1 . . .
. 1 1 1 . 1 1 1 . . .
. 1 * 1 . . . . . .
. 1 1 1 . . . . . .
```

```
[run_dependent_text]
log: ^\d+{REPLACE <timestamp>}
[end]
```

```
assertEquals(2, clueAt(0,1))
assertEquals(1, clueAt(1,0))
...
```

Approval tests: advantages

- Find defects you didn't anticipate
- Less work to create new test cases
- When behaviour changes, easy to update many tests
